Normal pulse Nd:glass lasers are available with pulse energy up to hundreds of joules. Q-switched Nd:glass lasers are available with pulse duration in the nanosecond regime, and with pulse energy ranging from a fraction of one joule to more than 100 J. In the higher-energy range, the laser is usually configured as a master oscillator, power amplifier system.

What we've mentioned about glass and lasers can also apply to stained glass. That being said, there are some exceptions. If you're working with thick stained glass, you'll need a laser somewhere near 40W for etching a design. If you want to cut through it, only the most powerful laser, like a 100W, will do the job accurately and smoothly.

Laser Etched Glass Unlike Sandblasting, laser etching requires heat to melt the microsurface of the target material. A laser beam delivers heat energy to etch the computer's pre-loaded design. The clear takeaway from the definition of both terms is that a laser etched glass is a product of heat applied to its surface.
